Languages: Bangla (native) · English (professional) · Hindi (conversational)

PROFESSIONAL SUMMARY

Full stack developer with two years of production experience across the whole stack of a web product. Built the entire **Next.js 16 / React 19 / TypeScript** frontend of my own SaaS platform — feature-sliced architecture, TanStack Query, Zustand, drag-and-drop content management — on top of a **REST API** and **PostgreSQL** schema I also designed. Promoted to Senior Python Executive at Softvance Agency within eleven months for delivering eight production backends, including a **multi-tenant B2B SaaS** with business scoping and role-based access control, and **OpenAI integration with per-request cost and token accounting**. Server-side work is Python — Django REST Framework and FastAPI — with **Redis** and **Celery** for queued background jobs, scheduled tasks, retries and worker isolation; the queue and worker architecture is the transferable part, and I use **Claude** coding tools daily. I run my own **CI/CD and DevOps**: Docker, GitHub Actions and deployment to AWS and VPS hosts.

TECHNICAL SKILLS

Frontend: React 19 · Next.js 16 (App Router, route groups, server/client components, loading and error boundaries) · TypeScript 5 · Tailwind CSS 4 · TanStack Query · Zustand · React Hook Form + Zod · shadcn/ui + Radix · dnd-kit · Redux Toolkit · Vite · Vitest · HTML5 / CSS3 / JavaScript ES6

REST API & API integration: REST API design, versioning and pagination · unified response envelope · JWT with refresh-token rotation and blacklisting · OAuth 2.0 / Google OAuth · rate limiting · idempotent webhook contracts · Axios interceptors with silent token refresh · OpenAPI / Swagger, Bruno and Postman collections

Databases & caching: PostgreSQL · MySQL · **Redis 7** as cache, job broker and OTP store · schema design and normalisation · ERD modelling · indexing · query optimisation and N+1 elimination

Background jobs & queues: Celery + Celery Beat over Redis — isolated queues with explicit routing keys, scheduled and cron-driven jobs, retry with exponential backoff, watchdog tasks that fail and refund stalled work · WebSockets via Django Channels

Multi-tenant architecture: Organisation/business scoping · role-based access control and permission groups · invitation flows with expiring tokens · super-admin consoles · per-tenant configuration · domain-driven modularisation with bounded contexts

AI: OpenAI API with per-request cost and token accounting · google-genai · ElevenLabs · **Claude Code** and Cursor in daily production use, with committed architectural rule-sets that constrain what the agent may generate

Git, CI/CD & DevOps: Git and GitHub (branching strategies, pull-request workflows) · GitHub Actions CI/CD · Docker (multi-stage) · Docker Compose · AWS EC2, IAM, S3, SES, RDS · Hostinger VPS · Cloudflare R2 · Nginx · Caddy · Linux · Sentry · structured logging and health dashboards

Server-side languages & frameworks: Python 3 (primary) · Django 5.2 · Django REST Framework · FastAPI · SQL · PHP · TypeScript / JavaScript

PROFESSIONAL EXPERIENCE

Senior Python Executive — Softvance Agency

Aug 2025 – Present

Dhaka, Bangladesh · Promoted from Junior Python Developer, Jul 2026 · US, German, Middle Eastern, Brazilian and Australian end-clients

- **Delivered eight production client backends in eleven months** — four on Django REST Framework, four on FastAPI — owning each from PostgreSQL data model and REST API surface through Docker image, CI/CD pipeline and live deployment. Sole backend developer on several.
- **Built a multi-tenant B2B SaaS platform** with business-scoped data, role-based membership, invitation flows with expiring tokens provisioned in a single atomic transaction, and a metered subscription engine with usage limits and overage pricing across dual payment providers.
- **Ran Redis-backed queues as production infrastructure:** isolated Celery queues with explicit routing keys so slow analytics writes can never block business tasks, scheduled renewal jobs that apply deferred plan changes at the next billing cycle, and a Beat watchdog that auto-fails and refunds any job stalled past a six-hour SLA.
- **Integrated OpenAI with real cost control** — per-day, per-project cost and token accounting with an audited sync run and an adjustment ledger, so the business could see its true unit economics per generated record rather than a monthly bill.
- **Owned CI/CD and DevOps personally on every project** — multi-stage Docker images, Compose stacks split by environment, GitHub Actions pipelines (migration-drift gate → build → push → containerised test run → SSH deploy), and provisioning on AWS EC2 and Hostinger VPS behind Nginx or Caddy.
- **Used Claude Code and Cursor daily while keeping architecture human-owned** — per-repository rule files agents must follow (performance-first querying, strict separation of concerns, no placeholder implementations), with generated code reviewed against them before it lands.
- **Worked remotely with international clients as normal practice** — requirement analysis from recorded calls, written specifications, API documentation and screen-recorded demos across US, German, Middle Eastern, Brazilian and Australian time zones.

Founder, Lead Engineer & Designer — Omnyvora

Jun 2026 – Present

Own organisation · github.com/orgs/omnyvora · Sole contributor across frontend, backend and design

- **Built the complete Next.js 16 / React 19 / TypeScript frontend** of a multi-tool SaaS platform — feature-sliced architecture, route groups behind auth and guest guards, TanStack Query for server state, Zustand for client state, React Hook Form + Zod validation, and drag-and-drop content management on dnd-kit backed by bulk reorder endpoints.
- **Solved token security and race conditions in the API client:** access token held in memory only, refresh token rotated, and an Axios response interceptor that on a 401 performs a silent refresh and **queues every concurrent in-flight request behind that single refresh** before replaying them — with the trade-off documented in code.
- **Designed the platform's design system from scratch** — a four-tier token architecture where each product re-themes itself by swapping two CSS custom properties, a 20-component UI kit, dual light/dark semantics, and a lint config that fails the build on a hardcoded colour.

Web Development Intern — Cyber Hundred

Feb 2024 – Jul 2024

Dhaka, Bangladesh · On-site

- Built frontend and backend features in HTML5, CSS, Bootstrap, PHP and MySQL across multiple client web projects; documented workflows and used Git and GitHub for collaborative development.

SELECTED PROJECTS

CHYR — Multi-Tenant AI Voice-Receptionist SaaS · backend developer

Apr 2026 – May 2026

Django REST Framework · PostgreSQL · Redis · Celery · Stripe · Tap Payments · ElevenLabs · AWS EC2 (two regions)

- **Owned auth, payments, subscriptions, OTP and logging across a 13-app multi-tenant platform** — typed business verticals with normalised service catalogues under a unique matching key, role-scoped organisation membership, and a subscription engine metering feature usage against plan limits at call time.
- **Abstracted two payment providers behind one interface** — Stripe and Tap Payments over a provider enum with lazily created customer records, so a tenant is only registered with a payment service on its first charge, plus a retry and dunning state machine for failed regional card billing.

ProspectLead — AI Lead-Generation SaaS · lead backend developer and UI/UX designer

Jan 2026 – Jul 2026

prospectlead.ai · Django REST Framework · PostgreSQL · Redis · Celery · Stripe · OpenAI · n8n · Docker · Caddy

- **Owned architecture, billing, the leads pipeline and observability** — credits reserved on submit and finalised on callback so concurrent jobs cannot overspend, automatic refunds on under-delivery, idempotent Stripe webhooks, and Google OAuth alongside two-step OTP registration.
- **Designed the product's landing page, dashboard and auth screens** and built the n8n automation workflow itself — a Google Maps scrape feeding an AI extraction stage — then wrote the specification the whole team worked from.

Tundra — AI-Enhanced E-Commerce Platform · backend developer

Apr 2026 – May 2026

thundra.de · Next.js frontend + Django REST backend + FastAPI AI service · PostgreSQL · Celery · Stripe · AWS EC2 · Caddy

- **Built the API backend of a three-service estate** — Next.js frontend, Django API and a FastAPI image-generation service, each independently containerised with its own CI/CD pipeline behind a shared reverse proxy. Owned the discount engine, order and fulfilment flow, wallet and Stripe payments, and ran a documented pass eliminating N+1 queries on the catalogue endpoints.
- **Wrote the client's operations handover in plain language** — six chapters covering server setup, GitHub and Docker Hub, per-service CI/CD, how migrations run in the pipeline, and a closing security chapter that revokes my own access and rolls the payment keys.

Also delivered — **OCReels** (ocreels.com, async FastAPI short-video platform, Sentry and Locust load testing) · **ArchiCoPro**

(archicopro.cloud, FastAPI member portal with feature-level RBAC) · **LookUp** (geospatial building recognition with a gamified XP economy) · **django_templet**, my own open reusable REST API starter.

EDUCATION & CERTIFICATIONS

B.Sc. in Computer Science & Engineering

May 2020 – Jun 2024

IUBAT — International University of Business Agriculture and Technology, Dhaka · CGPA 3.59 / 4.00

- **Thesis:** *Implementation of Parallel Data Transmission in Li-Fi Technology Using RGB Light.* **Coursework:** Data Structures & Algorithms · Software Engineering · DBMS · Operating Systems · Computer Networks · Compiler Design.

Python-Django — EDGE, Enhancing Digital Government and Economy (Bangladesh Government ICT programme) · Jul 2025 ·

Internship Certificate — Cyber Hundred · Jun 2024 · References available on request.
