PROFESSIONAL SUMMARY

Python developer who builds and scales production backends and their **REST APIs** — eight client platforms in eleven months, **four on FastAPI** and four on Django REST Framework. Currently **Senior Python Executive at Softvence Agency**, promoted from Junior Python Developer within eleven months. The work maps onto this role directly: a **two-sided marketplace** backend with separate customer payments and provider payouts, a **high-traffic** video platform served across six domains behind a CDN and load-tested with Locust, and a **credit-wallet** engine behind Stripe and Tap **Payments**. **PostgreSQL** design and query optimization, **authentication and security** — JWT rotation and blacklisting, TOTP two-factor, RBAC, rate limiting — and **backend architecture** are the parts I own, through to production — **Docker**, **GitHub Actions** CI/CD, **Linux** server provisioning, **AWS** EC2, S3 and SES, and **Nginx** in front.

TECHNICAL SKILLS

Python & FastAPI: Python 3.11–3.13 (primary) · **FastAPI 0.119** · Pydantic v2 · `async/await`, `asyncio`, `application-factory` and `lifespan` patterns · `Uvicorn` · `Tortoise ORM` + `Aerich` migrations · `asyncpg` · **Django 5.2 / Django REST Framework 3.16** · `Django Channels` · `Gunicorn` · `Celery 5` + `Celery Beat`

PostgreSQL & database optimization: **PostgreSQL** (primary; `psycopg3`, `asyncpg`) · `MySQL` · `SQLite` · `Redis 7` · **database design**, normalisation and ER modelling · **query optimization** — composite indexing, N+1 elimination via `select_related/prefetch_related`, `bulk_update` over per-row saves · database-level constraints, custom managers, soft delete · migrations and drift gating

REST API development & integration: **REST API** design, versioning and documentation · unified response envelope · pagination, filtering, throttling · `Swagger / OpenAPI` · idempotent webhook contracts · **integrations:** Stripe, Tap Payments, OpenAI, Twilio, Firebase Cloud Messaging, Google OAuth 2.0, n8n

Authentication, security & backend architecture: **JWT** with refresh-token rotation and blacklisting (`SimpleJWT`, `python-jose`, `PyJWT`) · **OAuth 2.0** / Google social login · TOTP two-factor (`pyotp`) · `SHA-256` hashed single-use OTP · **RBAC**, permission groups and per-resource overrides · `bcrypt` / `passlib` · rate limiting, `CORS` and `CSRF` hardening · multi-tenancy · modular monolith with domain-driven service-selector layering

Docker, Nginx, Linux & AWS: **Docker** / Dockerisation (multi-stage builds, `Compose` stacks split by concern) · **Nginx** reverse proxy · `Caddy` · **Linux** server provisioning, `SSH` key management, deploy users · **AWS** EC2 (multi-region, Elastic IP), `IAM`, **S3** with bucket policies, **SES**/SMTP with `DKIM` and `DMARC`, `RDS` · `Cloudflare R2` and `CDN` · `Hostinger VPS` · **GitHub Actions** **CI/CD** · database provisioning and backups

Git, testing & debugging: **Git / GitHub** — branching strategies, pull-request workflow, code review · `pytest` + `pytest-asyncio` · `Django TestCase` · `Bruno` and `Postman` collections · **Locust** load testing · `Sentry` · structured logging with request-scoped context · live health dashboards

Marketplace, payments & high-traffic platforms: Two-sided **marketplace** modelling — service areas, availability, ratings, admin-configurable commission and payout terms · separate **payment** and **payout** money movement · **Stripe** subscriptions, invoices and idempotent webhooks · **Tap Payments** with `retry/dunning` · **credit-wallet** ledgers · `CDN`-fronted media and multi-domain `CORS` estates

PROFESSIONAL EXPERIENCE

Senior Python Executive — Softvence Agency

Aug 2025 – Present

Mohakhali, Dhaka · Full-time, on-site · Promoted from Junior Python Developer, Jul 2026

- **Built and scaled eight production client backends and their REST APIs** in eleven months — **four on FastAPI**, four on Django REST Framework — each owned end to end from data model through API, containerisation and live deployment.
- **Promoted from Junior Python Developer to Senior Python Executive within eleven months**, on end-to-end delivery ownership across those projects.
- **Delivered the money-movement layer on marketplace and SaaS platforms** — separate customer-payment and provider-payout models, **credit-wallet** ledgers with a running-balance snapshot on every row, and a dual-provider payment abstraction spanning **Stripe** and **Tap Payments**, so a business is only registered with a payment provider on its first charge.
- **Design PostgreSQL schemas and the queries that read them efficiently** — normalised models with database-level uniqueness constraints and composite indexes on every query path, N+1 elimination through `select_related/prefetch_related`, and `bulk` writes instead of per-row saves.
- **Own authentication, security and backend architecture** across projects — **JWT** with refresh-token rotation and blacklisting, `SHA-256`-hashed single-use OTP, TOTP two-factor, per-scope rate limiting, multi-tenant role-based access control with expiring invitation tokens, and a custom permission class that closes a real gap in DRF by enforcing read permissions that its default deliberately skips.
- **Own the infrastructure alongside the application code on every project** — multi-stage **Docker** images, **GitHub Actions** **CI/CD**, **Linux** server provisioning, database setup and backups, **S3** buckets and policies, **SES**/SMTP with `DKIM` and `DMARC` records, and **Nginx** or `Caddy` as reverse proxy.
- **Resolve deployment and infrastructure issues on colleagues' projects as well as my own** — debugging **CI/CD** pipelines, **Docker** builds, **AWS** provisioning and hosting configuration across the team's projects.
- **Debug production systems from structured evidence** — a non-blocking structured-logging pipeline writing to a queryable log model with request-scoped context (request ID, actor, IP) carried through `contextvars`, plus `Sentry` and a live health dashboard

covering database, Redis, SMTP and Celery.

- **Integrate third-party APIs so retries and replays are safe** — Stripe, Tap Payments, OpenAI, Twilio, Firebase Cloud Messaging and n8n, each behind an idempotent webhook table keyed on a unique provider event ID, or an authenticated callback contract.

Founder, Lead Engineer & Designer — Omnyvora

Jun 2026 – Present

Own organisation · github.com/orgs/omnyvora · Sole contributor

- **Took a multi-tool SaaS platform from a blank repository to a running stack alone** — a Django REST modular monolith across four bounded domains with strict models → selectors → services → views layering and no cross-domain foreign keys, so any domain can be extracted into its own service without a rewrite. Containerisation, CI/CD and deployment included.

Web Development Intern — Cyber Hundred

Feb 2024 – Jul 2024

Khilkhet, Dhaka · On-site · Certificate issued Jun 2024

- Built frontend and backend features in HTML5, CSS, Bootstrap, PHP and MySQL across multiple client web projects; managed databases through phpMyAdmin; used Git and GitHub collaboratively.

SELECTED PROJECTS

Outdoorda — Two-Sided Field-Service Marketplace · backend developer

Jun 2026

FastAPI · Tortoise ORM · REST API · Docker Compose · Nginx reverse proxy · Linux VPS

- **Modelled a two-sided marketplace matching customers to field installers** — customer profiles on one side, and on the other a service-area coverage map, availability windows and ratings, so a job reaches only providers who cover it and are free.
- **Separated the two directions money travels** — distinct Payment (customer → platform) and Payout (platform → installer) models, with job-routing, commission and payout terms in admin-editable settings so the business changes its own rules without a deploy. Deployed behind Nginx on a Linux VPS.

OCReels — High-Traffic Short-Video Platform · backend developer

Jun 2026 – Jul 2026

ocreels.com · FastAPI 0.119 · Pydantic v2 · Tortoise ORM + Aerich · PostgreSQL (asyncpg) · Redis · Celery · Locust · Docker · AWS EC2 + RDS · Cloudflare R2

- **Built on a fully asynchronous, auto-discovering FastAPI architecture** — an application factory whose async lifespan initialises database, Redis, scheduler and permission sync, then registers routes dynamically, so adding a domain needs no change to main.py.
- **Served the platform at production scale** — media behind a CDN origin on Cloudflare R2 with immutable one-year cache headers, Locust load testing and Sentry in the loop, and CORS, CSRF and cookie-domain configuration across a six-domain estate, on AWS EC2 with an Elastic IP, RDS and scoped IAM users.

ProspectLead — Credit-Wallet SaaS Platform · lead backend developer

Jan 2026 – Jul 2026

prospectlead.ai · Python · Django REST Framework · PostgreSQL · Redis · Celery + Beat · Stripe · Docker · Caddy · Bruno

- **Owned the credit-wallet billing engine end to end** — an append-only transaction ledger storing signed amounts, a typed reason and a running-balance snapshot per row, with reserve-on-submit / finalise-on-callback semantics so concurrent jobs cannot overspend a balance, and automatic refunds when a job under-delivers.
- **Made Stripe and an external long-running pipeline safe to depend on** — checkout sessions recorded against a webhook table with a unique event ID so replays are idempotent, plus a Celery Beat watchdog that auto-fails and refunds any request unanswered after six hours.

CHYR — Multi-Tenant B2B SaaS Platform · backend developer

Apr 2026 – May 2026

Python · Django 5.2 · DRF · PostgreSQL · Redis · Celery + Beat · Stripe · Tap Payments · Docker · AWS EC2 (two regions), IAM, SES

- **Built the dual payment-provider abstraction** — payment, invoice, webhook-event and payment-method models over a provider enum, with customer records created lazily on first charge, plus a subscription engine covering trials, metered usage, scheduled plan changes and a Tap retry/dunning state machine.

Also delivered — ArchiCoPro (archicopro.cloud · FastAPI members' portal, lead backend developer) · Tundra (thundra.de · three-service Django + FastAPI estate, each service independently containerised with its own CI/CD pipeline behind one proxy, including the client's server-setup and handover guide) · LookUp (Django REST geospatial backend, sole developer).

INFRASTRUCTURE & DEPLOYMENT

Every service ships in a multi-stage Docker build whose entrypoint runs migrations before the server starts, behind a GitHub Actions pipeline that fails on migration drift, pushes the image, then deploys over SSH with a pull-retry loop. Server-side work covers Linux host and AWS account provisioning — EC2 with scoped IAM users, PostgreSQL, S3 with explicit bucket policies, SES with DKIM and DMARC records, Nginx or Caddy as reverse proxy, and per-project backups of database, environment and server configuration.

EDUCATION & CERTIFICATIONS

B.Sc. in Computer Science & Engineering

May 2020 – Jun 2024

IUBAT — International University of Business Agriculture and Technology, Dhaka · CGPA 3.59 / 4.00 · Degree certificate issued 30 May 2024

- **Thesis: Implementation of Parallel Data Transmission in Li-Fi Technology Using RGB Light.** Coursework: Data Structures & Algorithms · DBMS · Software Engineering · Operating Systems · Computer Networks.

Python-Django — EDGE, Enhancing Digital Government and Economy (Bangladesh Government ICT programme) · Jul 2025

Internship Certificate — Cyber Hundred · Jun 2024 · References available on request.
